## BACKGROUND OF THE INVENTION

Glycogen synthase kinase 3 (GSK3) is a serine / threonine protein kinase composed of two isoforms ( $\alpha$  and  $\beta$ ), which are encoded by distinct genes but are highly homologous within the catalytic domain. GSK3 is highly expressed in the central and peripheral nervous system. GSK3 phosphorylates several substrates including tau,  $\beta$ -catenin, glycogen synthase, pyruvate dehydrogenase and elongation initiation factor 2b (eIF2b). Insulin and growth factors activate protein kinase B, which phosphorylates GSK3 on serine 9 residue and inactivates it.

*Alzheimer's Disease (AD) dementias, and taupathies.*

AD is characterized by cognitive decline, cholinergic dysfunction and neuronal death, neurofibrillary tangles and senile plaques consisting of amyloid- $\beta$  deposits. The sequence of these events in AD is unclear, but are believed to be related. Glycogen synthase kinase 3 $\beta$  (GSK3 $\beta$ ) or Tau ( $\tau$ ) phosphorylating kinase selectively phosphorylates the microtubule associated protein  $\tau$  in neurons at sites that are hyperphosphorylated in AD brains.

Hyperphosphorylated protein  $\tau$  has lower affinity for microtubules and accumulates as paired helical filaments, which are the main components that constitute neurofibrillary tangles and neuropil threads in AD brains. This results in depolymerization of microtubules, which leads to dying back of axons and neuritic dystrophy. Neurofibrillary tangles are consistently found in diseases such as AD, amyotrophic lateral sclerosis, parkinsonism-dementia of Gaum, corticobasal degeneration, dementia pugilistica and head trauma, Down's syndrome, postencephalatic parkinsonism, progressive supranuclear palsy, Niemann-Pick's Disease and Pick's Disease. Addition of amyloid- $\beta$  to primary

hippocampal cultures results in hyperphosphorylation of  $\tau$  and a paired helical filaments-like state via induction of GSK3 $\beta$  activity, followed by disruption of axonal transport and neuronal death (Imahori and Uchida., J. Biochem 121:179-188, 1997). GSK3 $\beta$  preferentially labels neurofibrillary tangles and has been shown to be active in pre-tangle neurons in AD brains. GSK3 protein levels are also increased by 50% in brain tissue from AD patients. Furthermore, GSK3 $\beta$  phosphorylates pyruvate dehydrogenase, a key enzyme in the glycolytic pathway and prevents the conversion of pyruvate to acetyl-Co-A (Hoshi et al., PNAS 93:2719-2723, 1996). Acetyl-Co-A is critical for the synthesis of acetylcholine, a neurotransmitter with cognitive functions. Thus, GSK3 $\beta$  inhibition may have beneficial effects in progression as well as the cognitive deficits associated with Alzheimer's disease and other above-referred to diseases.

#### *Chronic and Acute Neurodegenerative Diseases.*

Growth factor mediated activation of the PI3K /Akt pathway has been shown to play a key role in neuronal survival. The activation of this pathway results in GSK3 $\beta$  inhibition. Recent studies (Bhat et. al., PNAS 97:11074-11079 (2000)) indicate that GSK3 $\beta$  activity is increased in cellular and animal models of neurodegeneration such as cerebral ischemia or after growth factor deprivation. For example, the active site phosphorylation was increased in neurons vulnerable to apoptosis, a type of cell death commonly thought to occur in chronic and acute degenerative diseases such as Alzheimer's Disease, Parkinson's Disease, amyotrophic lateral sclerosis, Huntington's Disease and HIV dementia, ischemic stroke and head trauma. Lithium was neuroprotective in inhibiting apoptosis in cells and in the brain at doses that resulted in the inhibition of GSK3 $\beta$ . Thus GSK3 $\beta$  inhibitors could be useful in attenuating the course of neurodegenerative diseases.

#### *Bipolar Disorders (BD)*

Bipolar Disorders are characterised by manic episodes and depressive episodes. Lithium has been used to treat BD based on its mood stabilising effects. The disadvantage of lithium is the narrow therapeutic window and the danger of overdosing that can lead to lithium intoxication. The recent discovery that lithium inhibits GSK3 at therapeutic concentrations has raised the possibility that this enzyme represents a key target of lithium's action in the brain (Stambolic et al., Curr. Biol. 6:1664-1668, 1996; Klein and

Melton; PNAS 93:8455-8459, 1996). Inhibition of GSK3 $\beta$  may therefore be of therapeutic relevance in the treatment of BD as well as in AD patients that have affective disorders.

### *Schizophrenia*

5 GSK3 is involved in signal transduction cascades of multiple cellular processes, particularly during neural development. Kozlovsky et al (Am J Psychiatry 2000 May;157(5):831-3) found that GSK3 $\beta$  levels were 41% lower in the schizophrenic patients than in comparison subjects. This study indicates that schizophrenia involves neurodevelopmental pathology and that abnormal GSK3 regulation could play a role in  
10 schizophrenia. Furthermore, reduced  $\beta$ -catenin levels have been reported in patients exhibiting schizophrenia (Cotter et al., Neuroreport 9:1379-1383 (1998)).

### *Diabetes*

Insulin stimulates glycogen synthesis in skeletal muscles via the dephosphorylation and  
15 thus activation of glycogen synthase. Under resting conditions, GSK3 phosphorylates and inactivates glycogen synthase via dephosphorylation. GSK3 is also over-expressed in muscles from Type II diabetic patients (Nikoulina et al., Diabetes 2000 Feb;49(2):263-71). Inhibition of GSK3 increases the activity of glycogen synthase thereby decreasing glucose levels by its conversion to glycogen. GSK3 inhibition may therefore be of therapeutic  
20 relevance in the treatment of Type I and Type II diabetes and diabetic neuropathy.

### *Hair Loss*

GSK3 phosphorylates and degrades  $\beta$ -catenin.  $\beta$ -catenin is an effector of the pathway for keratin synthesis.  $\beta$ -catenin stabilisation may lead to increase hair development. Mice  
25 expressing a stabilised  $\beta$ -catenin by mutation of sites phosphorylated by GSK3 undergo a process resembling de novo hair morphogenesis (Gat et al., Cell 1998 Nov 25;95 (5):605-14)). The new follicles formed sebaceous glands and dermal papilla, normally established only in embryogenesis. Thus GSK3 inhibition may offer treatment for baldness.

30

### *Oral contraceptives*

Vijayaraghavan et al. (Biol Reprod 2000 Jun; 62 (6):1647-54) reported that GSK3 is high in motile versus immotile sperm. Immunocytochemistry revealed that GSK3 is present in the flagellum and the anterior portion of the sperm head. These data suggest that GSK3 could be a key element underlying motility initiation in the epididymis and regulation of mature sperm function. Inhibitors of GSK3 could be useful as contraceptives for males.

To the obtained brownish solution was added a solution of 2-chloro-5-[(4-methylpiperidin-1-yl)methyl]pyridine 1-oxide (163 mg, 0.677 mmol) in *N,N*-dimethylformamide (1.5 mL). The reaction mixture was heated at 130 °C for 25 min, and was then allowed to cool. The solvent was removed *in vacuo*, and to the residue was added 2 M HCl(aq). The obtained precipitate was partitioned between a saturated aqueous NaHCO<sub>3</sub> solution and ethyl acetate. The aqueous layer was extracted with another two portions of ethyl acetate. The combined organic layers were dried (Na<sub>2</sub>SO<sub>4</sub>), and the solvent was removed *in vacuo* affording a crude product. The material was dissolved in ethyl acetate (25 mL), and phosphorus trichloride (0.24 mL, 2.71 mmol) was added. An orange precipitate was immediately formed. The mixture was heated at reflux for 30 min, and was then allowed to cool. The mixture was partitioned between ethyl acetate and a saturated aqueous NaHCO<sub>3</sub> solution. The aqueous layer was extracted with another portion of ethyl acetate. The combined organic layers were dried (Na<sub>2</sub>SO<sub>4</sub>), and the solvent was evaporated. The crude product was purified on a silica gel column using chloroform/methanol, (95:5), as the eluent followed by preparative HPLC (column: Xterra, C<sub>8</sub>, 7 μm, 19x300mm; eluent: 0.1 M NH<sub>4</sub>OAc buffer/acetonitrile, 8:2 to 4:6) affording 4 mg (2% yield) of the title compound as an orange solid: <sup>1</sup>H NMR (acetone-d<sub>6</sub>, 400 MHz) δ 9.88 (br s, 1 H), 8.11 (d, *J* = 1 Hz, 1 H), 7.90 (dd, *J* = 9, 2 Hz, 1 H), 7.85 (d, *J* = 9 Hz, 1 H), 7.82 (d, *J* = 1 Hz, 1 H), 7.26 (dd, *J* = 8, 2 Hz, 1 H), 7.11 (d, *J* = 8 Hz, 1 H), 3.44 (s, 2 H), 2.91-2.86 (m, 2 H), 2.10-1.98 (m, 2 H), 1.65-1.59 (m, 2 H), 1.40-1.35 (m, 1 H), 1.28-1.16 (m, 2 H), 0.92 (d, *J* = 7 Hz, 3 H); MS (ES) *m/z* 347 (*M*<sup>+</sup>+1).

## PHARMACOLOGY

### *Determination of ATP competition in Scintillation Proximity GSK3β Assay*

#### GSK3β scintillation proximity assay.

The competition experiments were carried out in duplicate with 10 different concentrations of the inhibitors in clear-bottom microtiter plates (Wallac, Finland). A biotinylated peptide substrate, Biotin-Ala-Ala-Glu-Glu-Leu-Asp-Ser-Arg-Ala-Gly-Ser(PO<sub>3</sub>H<sub>2</sub>)-Pro-Gln-Leu (AstraZeneca, Lund), was added at a final concentration of 1 μM in an assay buffer containing 1 mU recombinant human GSK3β (Dundee University, UK), 12 mM morpholinepropanesulfonic acid (MOPS), pH 7.0, 0.3 mM EDTA, 0.01 % β-mercaptoethanol, 0.004 % Brij 35 (a natural detergent), 0.5 % glycerol and 0.5 μg BSA/25 μl. The reaction was initiated by the addition of 0.04 μCi [γ-<sup>33</sup>P]ATP (Amersham, UK) and

unlabelled ATP at a final concentration of 1  $\mu\text{M}$  and assay volume of 25  $\mu\text{l}$ . After incubation for 20 minutes at room temperature, each reaction was terminated by the addition of 25  $\mu\text{l}$  stop solution containing 5 mM EDTA, 50  $\mu\text{M}$  ATP, 0.1 % Triton X-100 and 0.25 mg streptavidin coated Scintillation Proximity Assay (SPA) beads (Amersham, UK). After 6 hours the radioactivity was determined in a liquid scintillation counter (1450 MicroBeta Trilux, Wallac). The inhibition curves were analysed by non-linear regression using GraphPad Prism, USA. The  $K_m$  value of ATP for GSK3 $\beta$ , used to calculate the inhibition constants ( $K_i$ ) of the various compounds, was 20  $\mu\text{M}$ .
